

Input pipeline: short trials are not enough

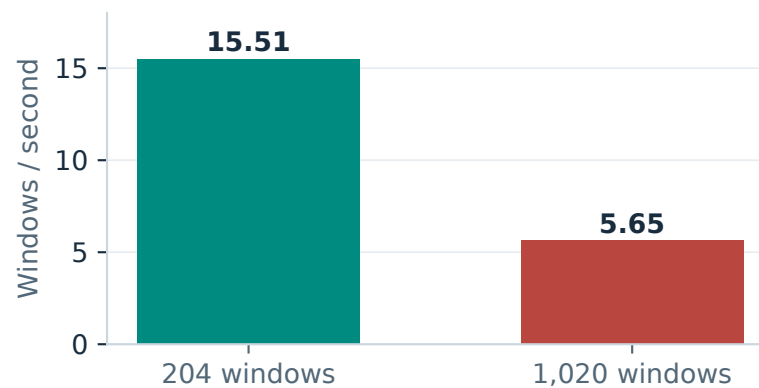

RTX 5060 Ti 16 GB | BF16 | Conv2d + query-only | 32-frame windows

Matched sweep: 204 windows; first 12 excluded. Initial verification: 308 s for 22.33 GB.

A Same windows, different input scheduling

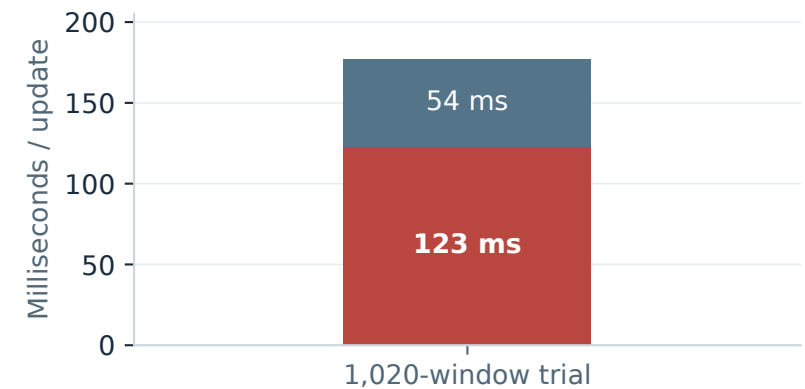

B Longer trial exposed a regression

Both: async / 2 workers / BS1 / mmap reader

C The long run remained input-bound

Input-ready wait Remaining step

Conclusion: do not adopt from the short sweep alone. Investigate first-read page faults and exact-range I/O.

One trial per condition. Verification/setup costs excluded above; no accuracy or convergence claim. Source: captured JSON, 2026-10-09.
